EYE ZONE AND LIDS
The lifting of this zone is popular with both genders between 30-40 years of age. As to upper and lower lids results show 40% absorbtion of grease cushions below lower lid with visible stretching of delicate skin of lower and and upper lids, which gives a fresh and rested look to the eye. This phenomenon is describes by patients as having more open eyes on account of tonus increase in the lids. Laughing wrikles around the eye, if deeper, are considerably reduced, following the prescribed protocol of the treatment. Fine and shallow wrinkles disappear almost completely leading to the filling of outer third of the eyebrow, which contributes consideralbly to the lifting results of this area.

NECK AND DECOLTE
Neck and decolte represent a vast area and signs of ageing are firstly visible in this zone. Plastic surgery has not yet found a response to this. This is a key reason why Pelleve lifting of this area should be done separately, because different technique and protocol apply in relation to the one applieed for the face zone.
